- Std screen perform is 1/4"

The Northern Self-Cleaning Suction Strainer is designed to keep the strainer screen clear in trashy water conditions. It can be used like a standard strainer and will operate at any angle from the bottom of the river or pond. The strainer requires a minimum of 40 PSI at 15-30 GPM from the pump discharge. The strainer will provide effective cleaning action in most applications at a very economical price. Our 180° ditch self-cleaning strainer is designed to be installed in the irrigation ditch. It screens the water before it enters the turnout. It is available to attach to most culvert sizes.
